Answers and Solutions to Common Problems in Unit 4

Understanding Polynomial Functions

Most problems involve identifying the degree, leading coefficient, and zeros of polynomial functions. Here is a typical approach:

- Factor the polynomial completely to find zeros.
- Determine the degree and leading coefficient to analyze end behavior.
- Use synthetic or long division for polynomial division problems.
- Apply the Fundamental Theorem of Algebra to find all zeros, including complex roots.

Sample problem:

Find the zeros and end behavior of the polynomial $P(x) = 2x^4 - 3x^3 + x - 5$.

Answer:

- The degree is 4 (even), leading coefficient is 2 (positive), so as $x \rightarrow \pm\infty$, $P(x) \rightarrow \infty$.
- To find zeros, factor or use synthetic division:

(Assuming synthetic division with rational roots)

Possible rational roots are divisors of constant term (-5) over divisors of leading coefficient 2: $(\pm 1, \pm 5, \pm \frac{1}{2}, \pm \frac{5}{2})$.

- Test these values to find actual zeros, then factor accordingly.

Analyzing Rational Functions

Problems often involve identifying asymptotes and holes:

Key steps:

- Vertical asymptotes: Set denominator equal to zero and exclude any common factors with numerator.
- Horizontal/Oblique asymptotes:
 - For horizontal, compare degrees of numerator and denominator.
 - For oblique, perform polynomial division when numerator degree exceeds denominator degree by exactly 1.
- Holes: Simplify the rational expression; if a factor cancels, the point where that factor is zero is a hole.

Sample problem:

Determine the asymptotes of $R(x) = \frac{x^2 - 1}{x^2 - 4}$.

Answer:

- Factor numerator and denominator:

$$R(x) = \frac{(x-1)(x+1)}{(x-2)(x+2)}$$

- Vertical asymptotes at $x=2$ and $x=-2$.
- Since degrees of numerator and denominator are equal (2), the horizontal asymptote is at $y = \frac{\text{leading coefficient of numerator}}{\text{leading coefficient of denominator}} = 1$.

Graphing Polynomial and Rational Functions

Graphing these functions involves multiple steps:

1. Find intercepts:

- x-intercepts: Set numerator equal to zero (for rational functions) or solve $(P(x) = 0)$ (for polynomials).
- y-intercept: Plug in $(x=0)$.

2. Determine end behavior:

Use the degree and leading coefficient.

3. Identify asymptotes:

As previously discussed, vertical, horizontal, or oblique asymptotes guide the shape of the graph.

4. Plot key points and asymptotes:

- Use test points in each region divided by asymptotes and zeros.
- Sketch the graph considering transformations such as shifts, stretches, and compressions.

Solving Polynomial and Rational Inequalities

Inequalities are often solved by:

- Rewriting the inequality as an equation equal to zero.
- Factoring the polynomial or rational expression.
- Finding critical points (zeros and undefined points).
- Using a sign chart to determine where the expression is positive or negative.
- Writing the solution interval based on the sign chart analysis.

Sample problem:

Solve $(\frac{x^2 - 4}{x - 1} > 0)$.

Answer:

- Factor numerator: $(x-2)(x+2)$.
- Critical points: $(x=-2, 1, 2)$.
- Test intervals: $((-\infty, -2))$, $((-2, 1))$, $((1, 2))$, $((2, \infty))$.
- Sign analysis yields the solution:

$x \in (-\infty, -2) \cup (2, \infty)$, excluding $x=1$ (where the expression is undefined).

Tips for Mastering Unit 4 Concepts

- Practice factoring polynomials thoroughly, including synthetic division and the Rational Root Theorem.
- Familiarize yourself with asymptote rules and their graphical implications.
