Deep Dive: Typical Calculus Semester B Questions and Their Solutions

To provide practical guidance, let's analyze some representative questions often found in the test, along with detailed solutions.

Question 1: Evaluating Limits and Continuity

Problem:

Evaluate the limit:

$$\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2}$$

Solution:

This problem tests understanding of limits and potential indeterminate forms.

Step 1: Recognize that directly substituting $(x=2)$ yields:

$$\frac{(2)^2 - 4}{2 - 2} = \frac{4 - 4}{0} = \frac{0}{0}$$

which is indeterminate.

Step 2: Factor numerator:

$$x^2 - 4 = (x - 2)(x + 2)$$

$$\frac{(x-2)(x+2)}{(x-2)} = x+2 \quad \text{for } x \neq 2$$

Step 3: Simplify:

$$\lim_{x \rightarrow 2} x + 2 = 4$$

$$\frac{(x-2)(x+2)}{(x-2)} = x+2 \quad \text{for } x \neq 2$$

$$\lim_{x \rightarrow 2} x + 2 = 4$$

Step 4: Take the limit:

$$\lim_{x \rightarrow 2} x + 2 = 4$$

$$\lim_{x \rightarrow 2} x + 2 = 4$$

$$\lim_{x \rightarrow 2} x + 2 = 4$$

Answer: The limit is 4.

Key Takeaway: Recognize indeterminate forms, factor expressions, and simplify to evaluate limits effectively.

Question 2: Derivative Application ? Optimization

Problem:

A company produces a product with a cost function $C(x) = 50x + 2000$, where x is the number of units produced. The revenue function is $R(x) = 80x$. Find the number of units to produce to maximize profit.

Solution:

This involves setting up and maximizing the profit function.

Step 1: Write profit function:

$$P(x) = R(x) - C(x) = 80x - (50x + 2000) = 30x - 2000$$

$$P(x) = R(x) - C(x) = 80x - (50x + 2000) = 30x - 2000$$

\]

Step 2: Find critical points by differentiating:

\[

$$P'(x) = 30$$

\]

Since $P'(x)$ is constant and positive, the profit increases with x . However, in real-world scenarios, constraints exist (e.g., production capacity).

Step 3: If no constraints are specified, profit increases indefinitely, but typically, the problem provides a production limit. Suppose the maximum units are 100 units.

Step 4: Evaluate profit at bounds:

- At $x=0$: $P(0) = -2000$
- At $x=100$: $P(100) = 30(100) - 2000 = 3000 - 2000 = 1000$

Conclusion:

Maximum profit at $x=100$ units within the constraint.

Key Takeaway:

Always consider constraints and check endpoints; the derivative indicates the trend but must be contextualized.

Question 3: Integration ? Area Under a Curve

Problem:

Calculate the area under $f(x) = x^2$ from $x=1$ to $x=3$.

Solution:

Step 1: Set up the definite integral:

$$\int$$

$$A = \int_1^3 x^2 \, dx$$

$$\int$$

Step 2: Find the antiderivative:

$$\int$$

$$\frac{x^3}{3}$$

$$\int$$

Step 3: Evaluate at bounds:

$$\int$$

$$A = \left[\frac{x^3}{3} \right]_1^3 = \frac{3^3}{3} - \frac{1^3}{3} = \frac{27}{3} - \frac{1}{3} = 9 - \frac{1}{3} = \frac{27}{3} - \frac{1}{3} = \frac{26}{3}$$

$$\int$$

Answer: The area under the curve is $\frac{26}{3}$.

Key Takeaway:

Mastery of basic integration rules and careful evaluation at bounds ensures accuracy.

Common Pitfalls and How to Avoid Them

- Misapplying Limit Laws:

Always verify if a limit is indeterminate before applying algebraic manipulations.

- Ignoring Domain Restrictions:

Functions may have domain restrictions; consider them when solving.

- Forgetting to Check Endpoints:

In optimization or area problems, evaluate all relevant points and boundaries.

- Calculation Errors:

Double-check arithmetic, especially with fractions and exponents.

- Overlooking Theorems:

Use theorems like Rolle's or the Mean Value Theorem appropriately to justify steps.
