Common Questions and Solutions from Chapter 21

Below are some typical questions from Chapter 21 and their corresponding answers, as found in the official answer key. These serve as examples to illustrate the depth and clarity of solutions provided.

Question 1: Define an ecosystem and explain its components.

Answer:

An ecosystem is a community of interacting organisms and their physical environment functioning as a unit. Its components include:

- Biotic factors: Living organisms such as plants, animals, fungi, and microorganisms.
- Abiotic factors: Non-living elements like sunlight, temperature, water, minerals, and soil.

Ecosystems are characterized by energy flow and nutrient cycling, maintaining ecological balance.

Question 2: Describe the flow of energy through a food chain.

Answer:

Energy flow in a food chain begins with producers (autotrophs) like plants, which convert sunlight into chemical energy through photosynthesis. Primary consumers (herbivores) consume producers, transferring energy. Secondary and tertiary consumers (carnivores and omnivores) eat the primary consumers, continuing the transfer.

At each trophic level, approximately 10% of energy is transferred to the next level, with the rest lost as heat due to metabolic processes, illustrating the inefficiency of energy transfer.

Question 3: Explain the concept of carrying capacity in population ecology.

Answer:

Carrying capacity refers to the maximum number of individuals of a species that an environment can sustainably support over time. It depends on resource availability, habitat conditions, and other environmental factors. When a population exceeds its carrying capacity, resources become limited, leading to a decline in population due to increased competition, starvation, or disease.

Question 4: Summarize the nitrogen cycle and its significance.

Answer:

The nitrogen cycle describes the movement of nitrogen through the atmosphere, soil, and living organisms. Key processes include:

- Nitrogen fixation: Conversion of atmospheric N_2 into ammonia by bacteria or lightning.
- Nitrification: Conversion of ammonia to nitrites and nitrates.
- Assimilation: Plants absorb nitrates and ammonia for growth.

- Ammonification: Decomposition of organic nitrogen into ammonia.
- Denitrification: Conversion of nitrates back into N_2 gas, returning nitrogen to the atmosphere.

This cycle is crucial for synthesizing amino acids, proteins, and nucleic acids, supporting life.
